# Urban growth and Sanitation

- In fast growing megacities, urban growth has a large impact on water cycle;
- Most research related to flooding;
- Waste water (management) largely affected;
- Proof of Concept;
- Lagos, Nigeria

**What can be the potential consequences of future urban growth on wastewater management?**

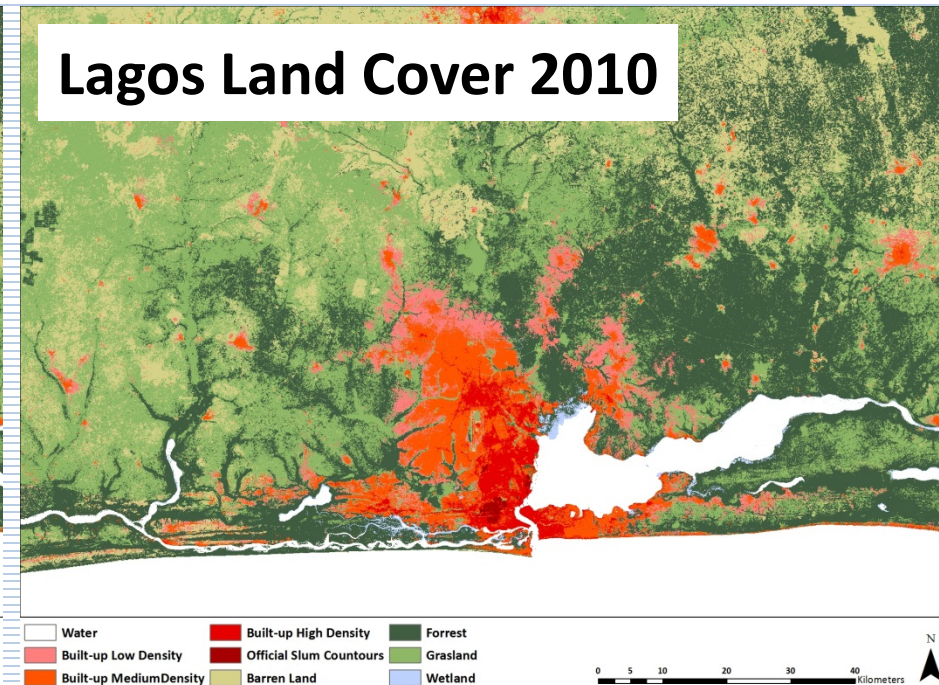

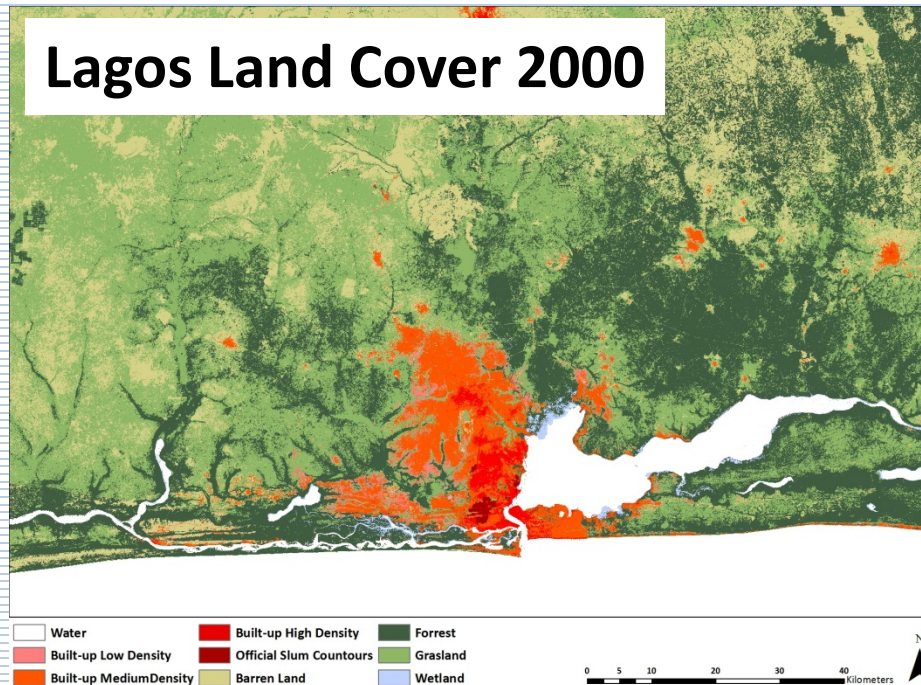

# Business As Usual in UGM

## UGM: Dinamica-Ego (CSR-UFMG) dynamic GIS platform

- Constrained stochastic CA;
- Weight-of-Evidence method (Bonham-Carter, 1994);
- Performance evaluation based on Kappa index;
- Projections are extrapolation of LULC differences between baseyears

# Weight of Evidence

- Determine set of LULC transitions;
- Assign weights to discrete ranges (e.g. distance) for a set of themes;
- Develop 'suitability map' (i.e. probability matrix);

# UGM: Thematic maps

- Evaluating the importance of physical and proximity based factors;
- Arbitrary set, yet agreement in UGM literature

# UGM: Methodology

- Preparation phase: LULC base years, thematic layers;
- Validation phase: Optimizing predicted-observed similarity base years
- Projection: Applying transition rules for n increments

## Preparation

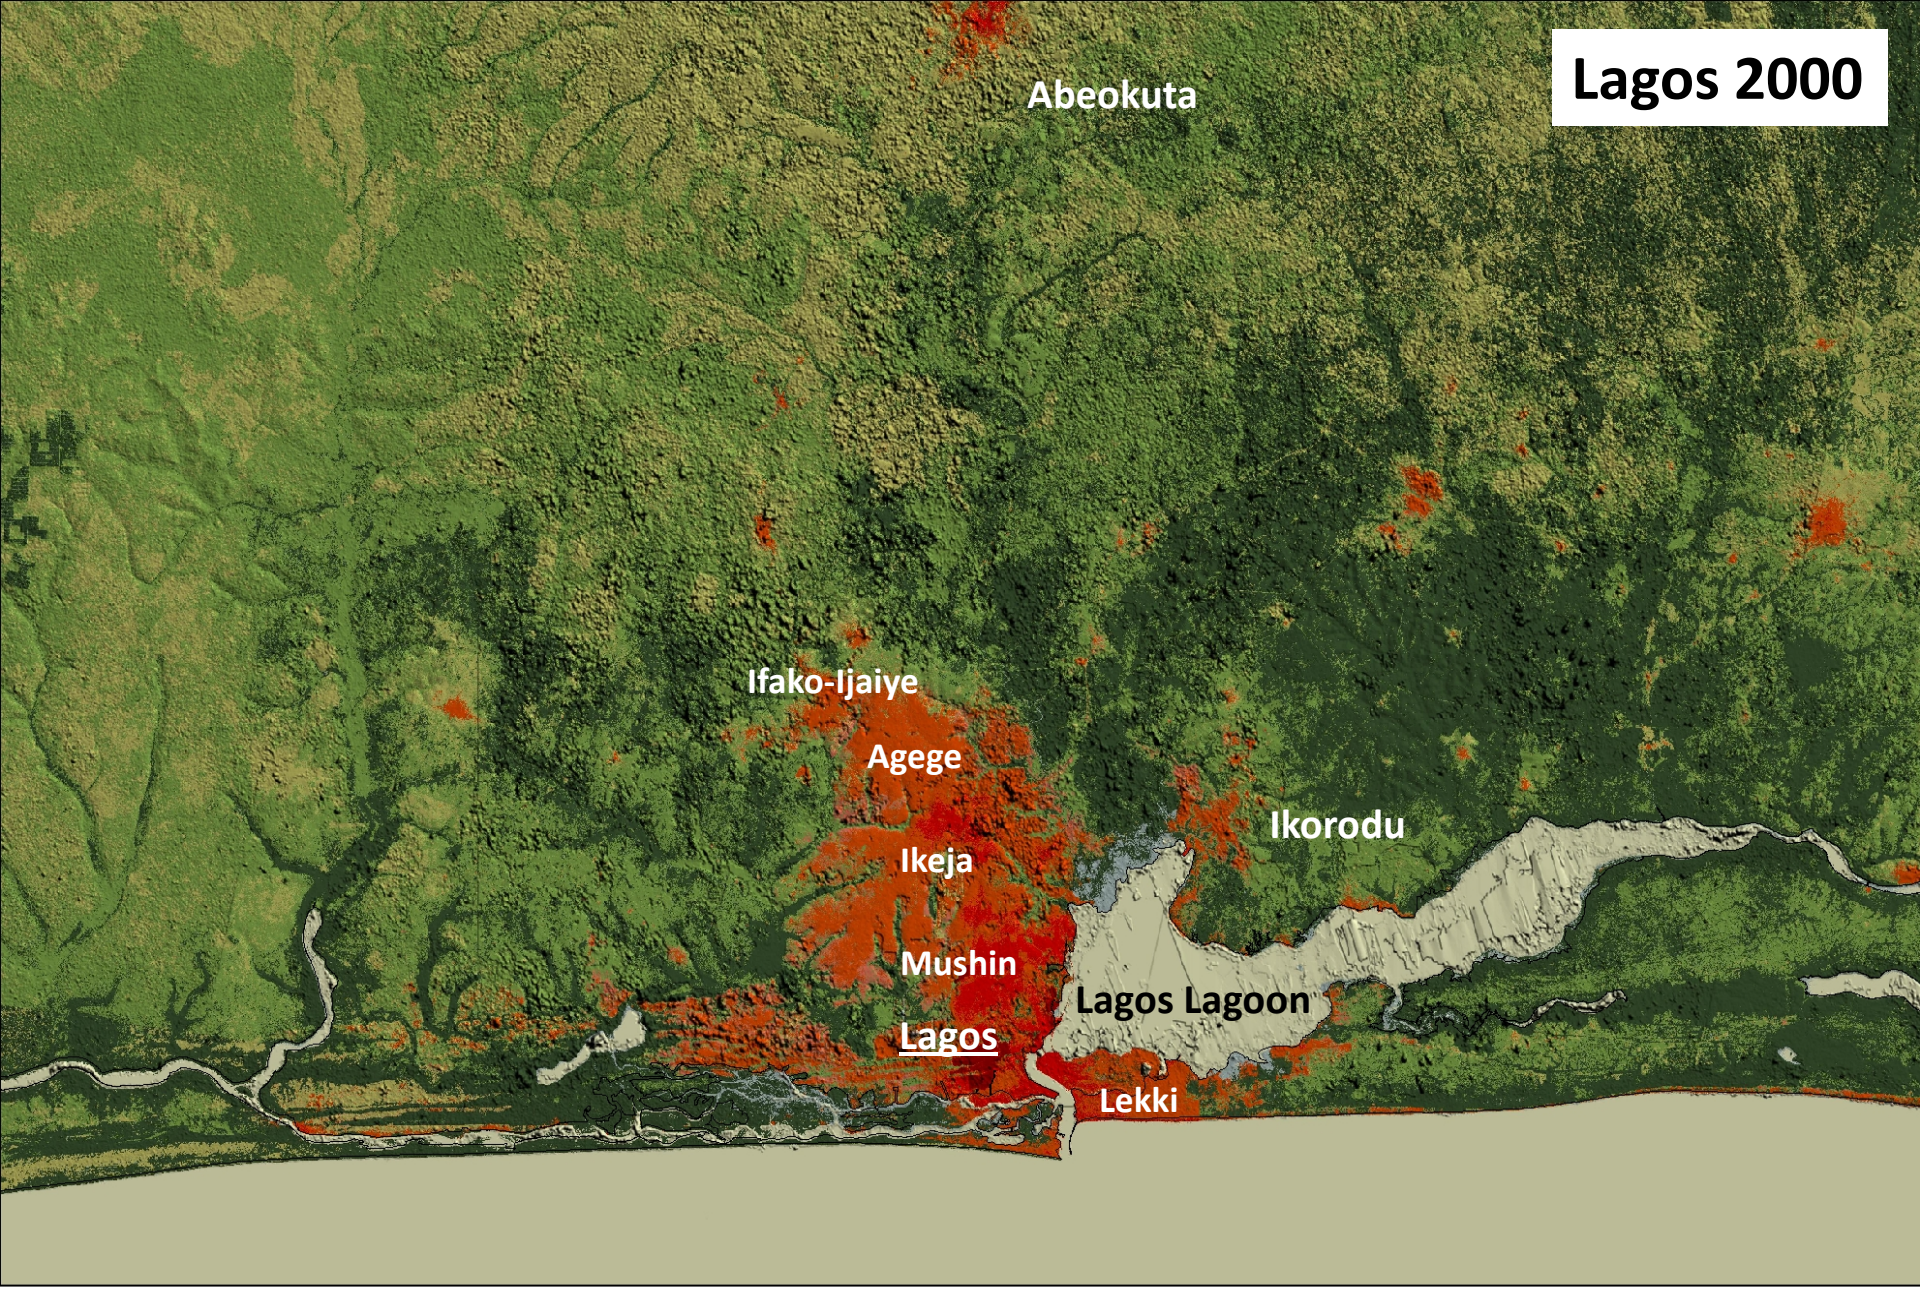

Thematic layers

Land cover base year 1

Land cover base year 2 (training and test)

# Sanitary pollution loads

- Delineate watersheds and slum areas;
- Associate population densities to the delineated slum areas;
- Assign baseline loads (Organics, Solids, Nutrients) based on Heinzl et al (2001) for base year 2010;
- Assess increased loads by distributing urban growth (population densities) over watersheds (2035, 2060);

COD	90 l/c/d
BOD	60 l/c/d
Nitrogen	5 l/c/d
Phosphorus	2 l/c/d
TSS	60 l/c/d

# Main watersheds

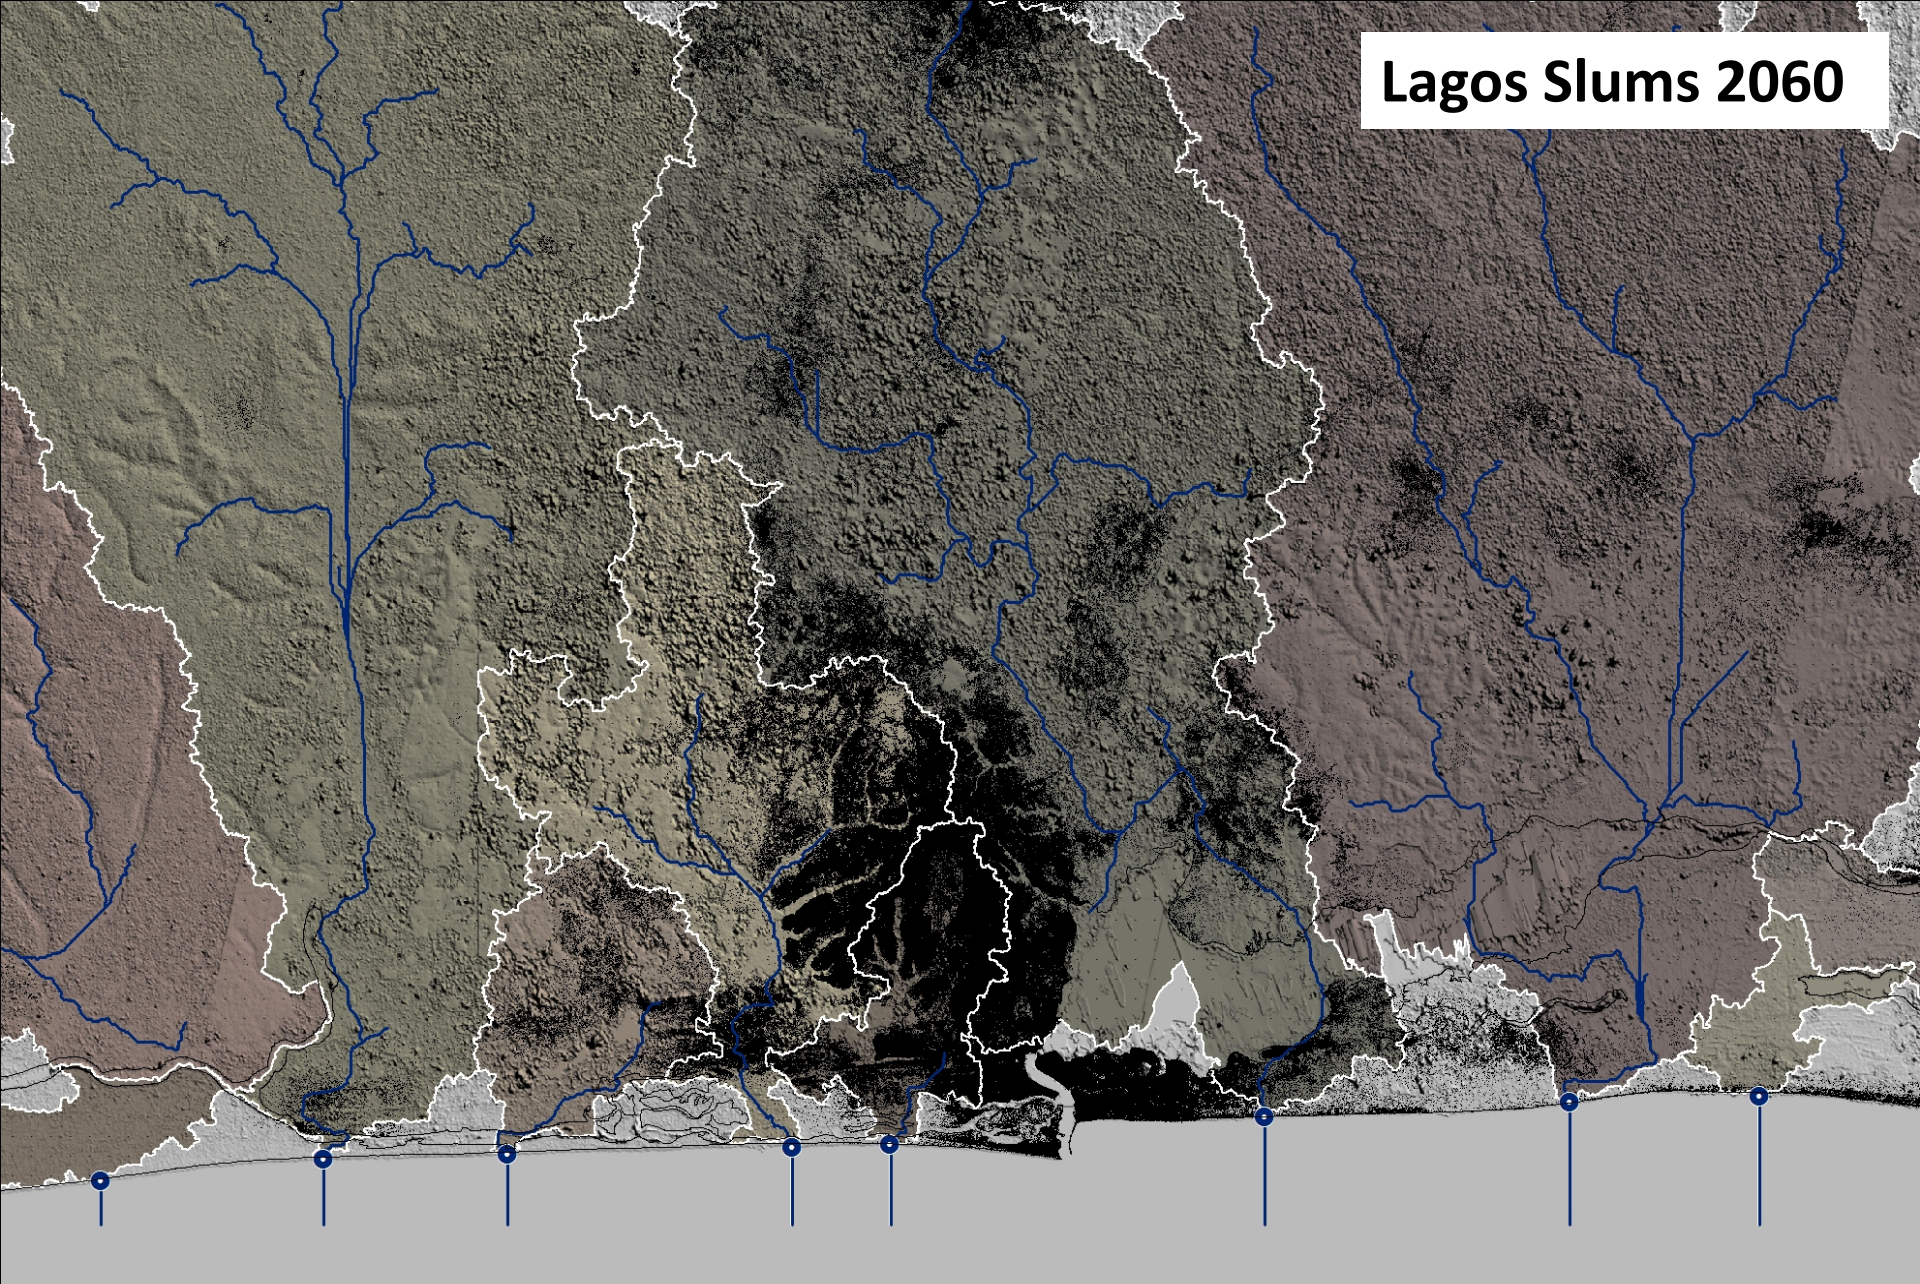

- Outlets
- Streams

# Lagos Slums 2060

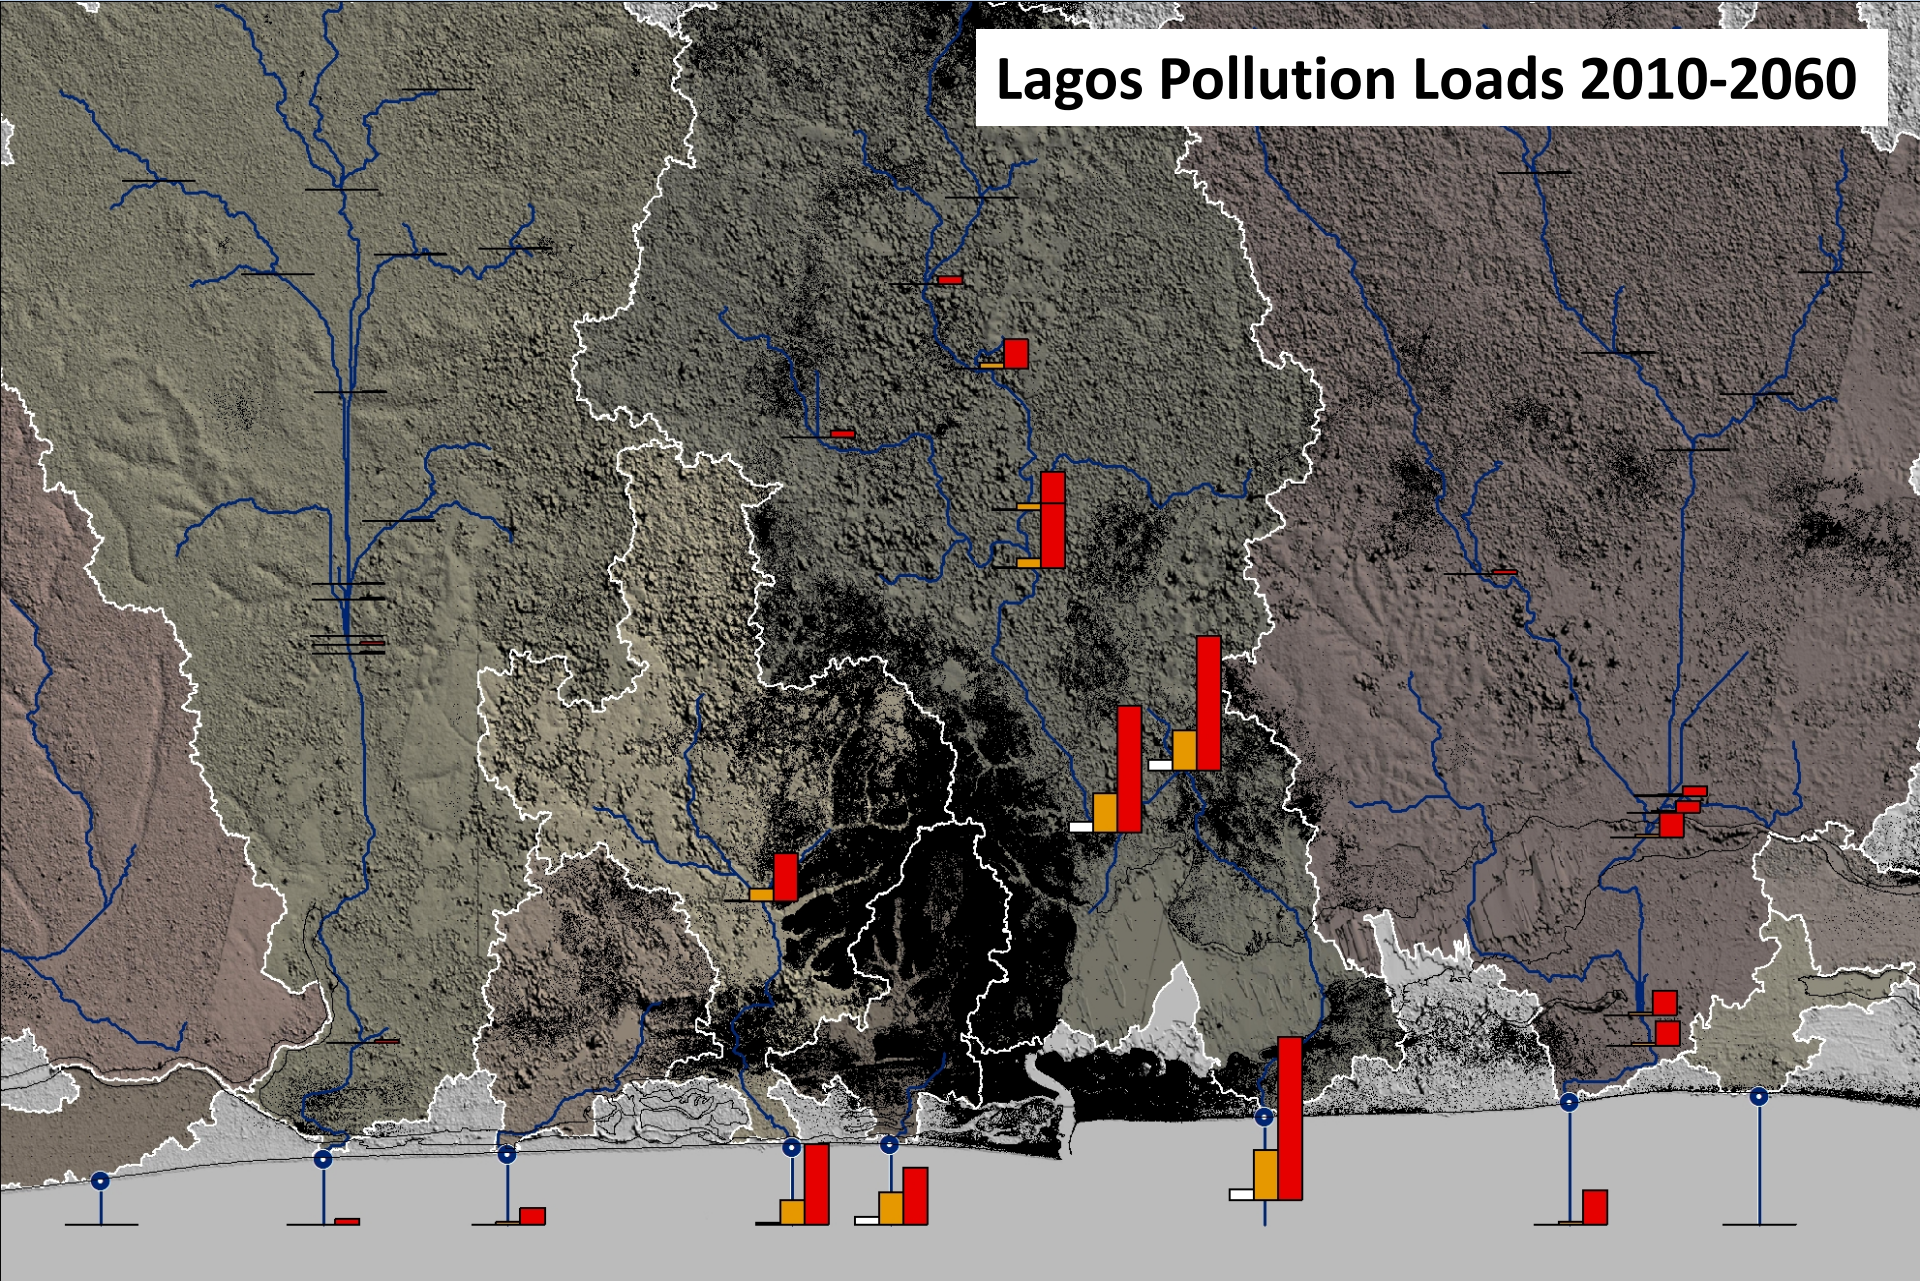

- Outlets
- Streams
- Slum Countours

# Lagos Pollution Loads 2010-2060

# Main Observations

- Overall: severe increase in pollution loads;
- Some currently unaffected streams will face serious future contamination;
- Big impact on the Laguna and livelihood (fishery, etc.);
- Outcomes could provide base for pro-active policy (slum formation, sanitation, etc.)

# Big Uncertainties

- Actual discharge into streams;
- Slum delineation;
- Future growth rates and development

# CONCLUSIONS

- **New application of UGM;**
- **Outcomes suggest a ecologic disaster with severe consequences for the current downtown areas (downstream) and Laguna;**
- **Pro-active growth containment and slum management is necessary;**
