MEHANIKA FULUIDA – NAPREDNI KURS

Simulira se prostorno, turbulentno strujanje u prizmatičnom kanalu u kojem su postavljene tri vertikalne prepreke nalik mostovskim stubovima.

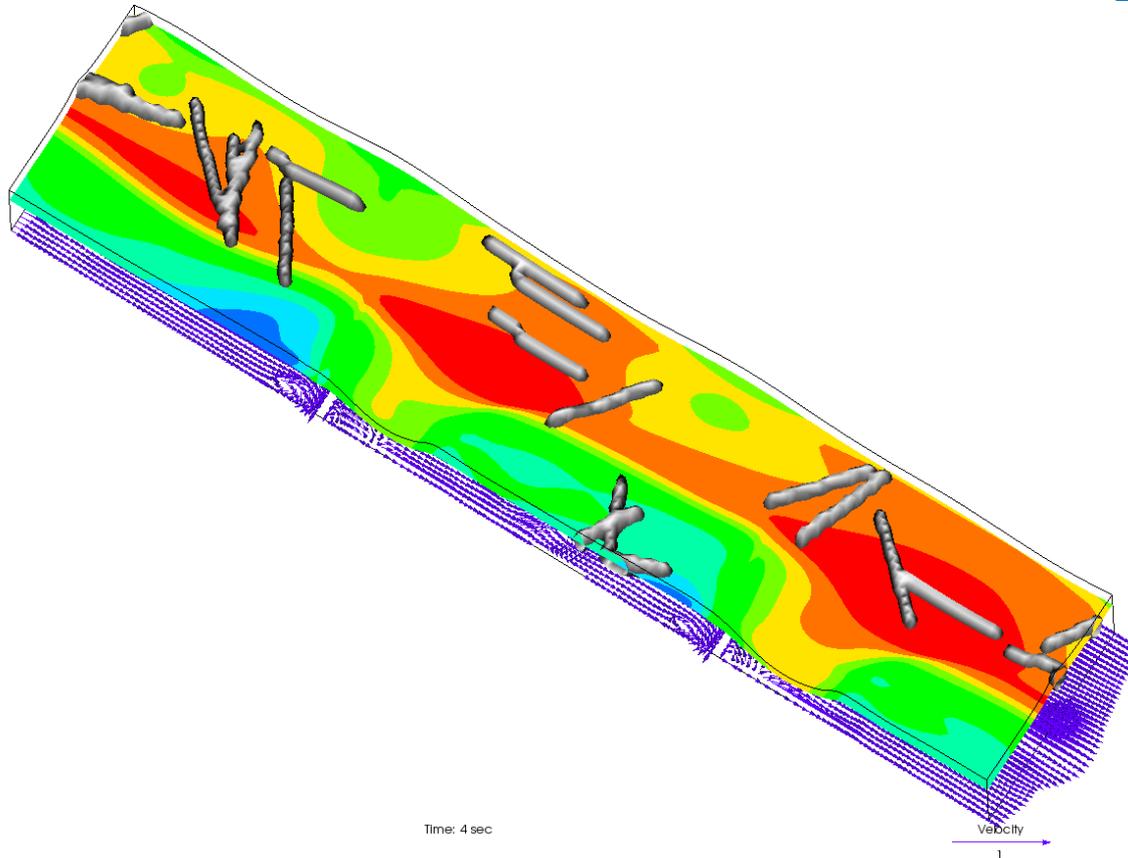

Posmatrati dva slučaja:

- Tečenje u kanalu bez prisustva plutajućih predmeta
- Tečenje u kanalu kada tok nosi plutajuće balvane

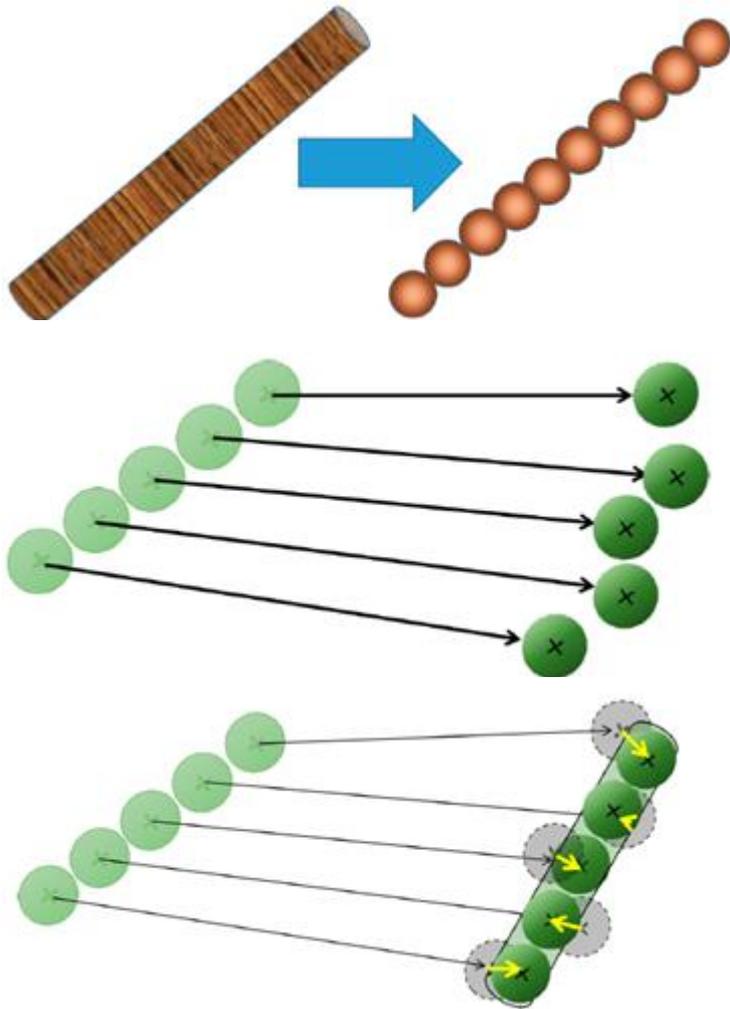

Poznavanjem osobina toka koji nosi plutajući materijal, moguće je predvideti preventivne mere i umanjiti negativne efekte:

- Gomilanje plivajućeg nanosa na suženjima u rečnom koritu
- Usporeno tečenje i podizanje nivoa vode
- Uzvodno plavljenje
- Oštećenje mostovskih stubova usled kolizije
- Rušenja mostovske konstrukcije

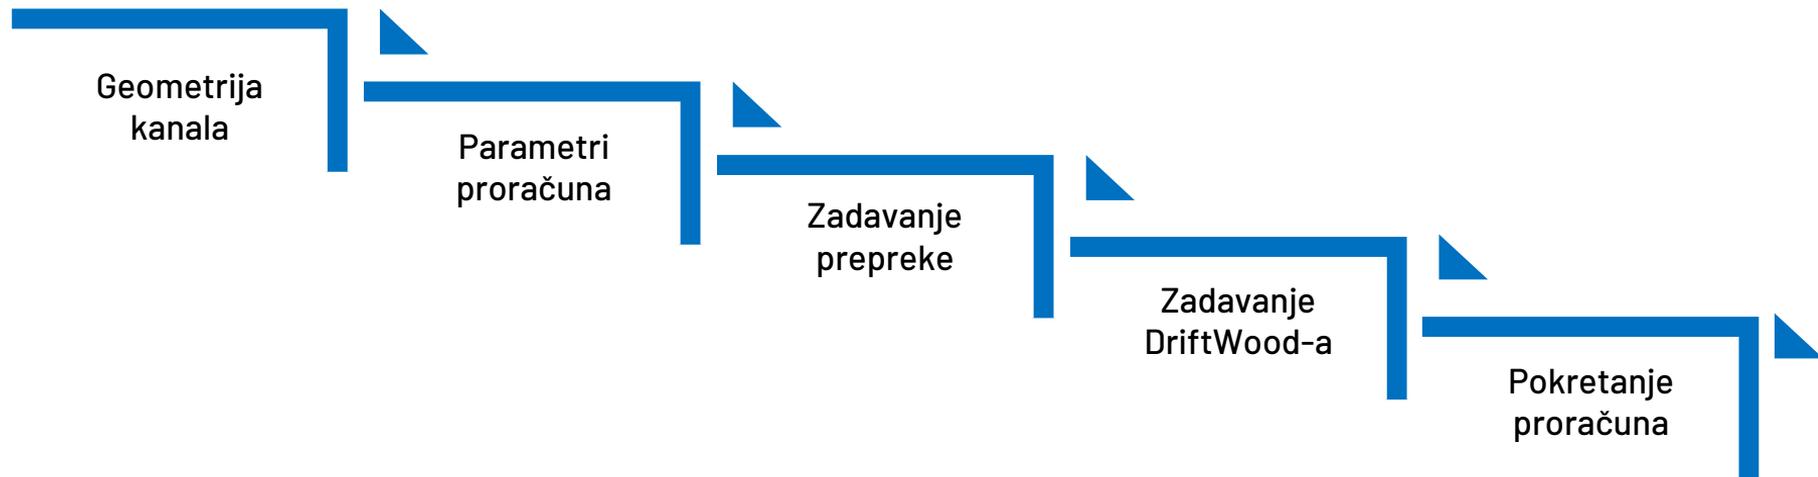

- Softver za proračun trodimenzionalnog tečenja u otvorenim tokovima i proračune defromacije rečnog korita
- Može da simulira sekundarna strujanja, opstrujavanje oko objekata u tokovima, tečenje u tokovima sa ili bez prepreka
- Nova funkcija proračuna kretnje drvenih komada, “driftwood”-a, je dodata u solver NaysCUBE softvera iRIC ver.3
- Verzijom 3.1 ova funkcija je proširena mogućnošću simulacije transporta objekta (krutog tela, bilo kog oblika) nošenog advektivnim strujanjem

- Komad drveta u modelu je prikazan preko sfera povezanih u niz
- Zanimaju se vezne sile između sfera i svaka od njih se pomera samostalno po zakonu koji je opisan Lagranžovom jednačinom kretanja
- Nakon pomeranja sfere se ne nalaze na istom pravcu
- U poslednjem koraku sfere se prilagođavaju i poravnavaju tako da ponovo postanu kolinearne

- Trajanje simulacije oko 60min
- Neporemećeno tečenje je ostvareno nakon 15s
- Nije došlo do zagušenja drvenih komada (Što je logično za ovakav raspored stubova i ovolike komade driftwooda)
- Nije primećen uticaj usporenog tečenja
- Vizuelnom metodom nisu opažene razlike u strujanju fluida bez drvenih komada i nakon ubacivanja drvenih komada u prizmatični kanal

Konstatacije nakon sprovedene simulacije osnovnog modela

Simulirana dodatna dva scenarija koja predstavljaju varijaciju podešavanja proračuna osnovnog modela sa ciljem ostvarenja uticaja na raspored brzina i dubina u kanalu:

- **Scenario 1:** Povećan broj drvenih komada na 200 i uključena opcija sudaranja
- **Scenario 2:** Povećan broj drvenih komada na 200, povećana je dužina komada na 0.2m, a prečnik na 0.05m

Zaključna razmatranja

- Različita prostorna raspodela drvenih komada prilikom sprovedenih simulacija
- Najveće zagušenje drvenih komada između stubova ostvareno je u Scenariju 2
- Nivoi i brzine u karakterističnim tačkama kroz posmatrane vremenske preseke u sve tri simulacije su isti. Nisu izazvane promene vrednosti, menjanjem parametara proračuna.
- U posmatranim tačkama kroz različite vremenske preseke opaža se povećanje nivoa i smanjenje brzina sa pojavom drvenih komada u toku prizmatičnog kanala

Ispitati osetljivost rezultata modela u odnosu na broj sfera od kojih se formira DriftWood

Ispitati osetljivost rezultata modela u odnosu na vučnu silu

Uporediti rezultate numeričkog modela sa fizičkim modelom

Umesto DriftWood-ova simulirati advekciju krutih objekata (krovova)
