Water Sensitive Cities

MONASH University

Model calibration, sensitivity & uncertainty analysis

- Bayes' theorem

$$p(\theta|d) = \frac{p(d|\theta)p(\theta)}{p(d)}$$

model parameters θ

measured calibration data d

$p(\theta|d)$ posterior distribution of θ for given d

$P(\theta)$ prior distribution of θ before constraining θ through calibration

$p(d|\theta)$ likelihood function (probability of observing d for given θ)

$p(d)$ distribution of observations

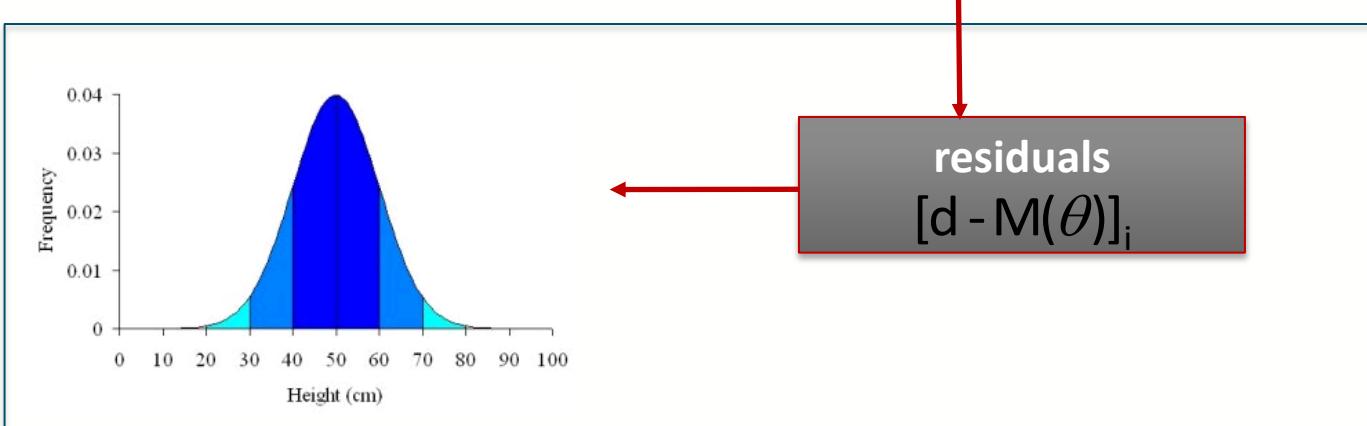

Model calibration, sensitivity & uncertainty analysis

Likelihood function

$$p(d|\theta) = \frac{\prod w_i \exp\left(-\frac{1}{2} \sum (d - M(\theta)_i w_i)^2\right)}{(2\pi)^{n/2}}$$

likelihood residual

Residuals

Not checked
 $N(0, \sigma)$

observations

model sensitivity

CRC for
Water Sensitive Cities

MONASH University

Aim

- impacts of verifying the normality assumption
on the model sensitivity and associated
parameter uncertainty

CRC for
Water Sensitive Cities

Models & Data

MUSIC

KAREN

- conceptual lumped models
- continuous simulation
- series of reservoirs
- flows impervious & pervious area
- 13 par

- simple linear reservoir
- flows impervious area
- 4 par

- 2 years rainfall & flow 6 min – urban catchment Melbourne (TIF 70%)

Scenarios

Scenarios

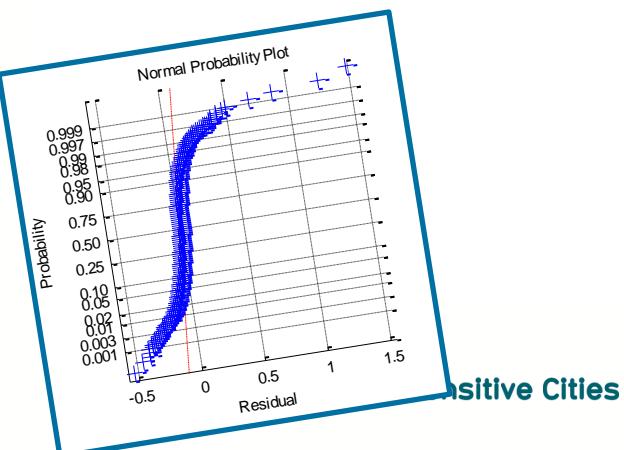

CRC for
Water Sensitive Cities

MONASH University

Scenarios

Scenarios	
<i>Unverified Not normal</i>	normality of the residuals was checked but not verified

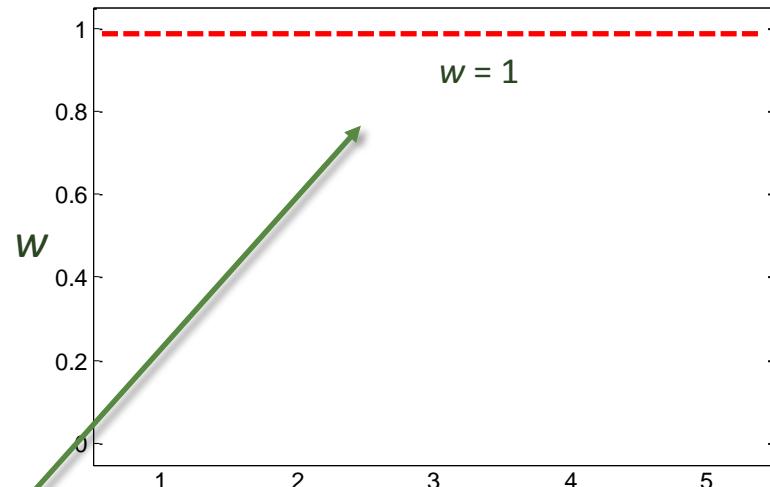

Scenarios

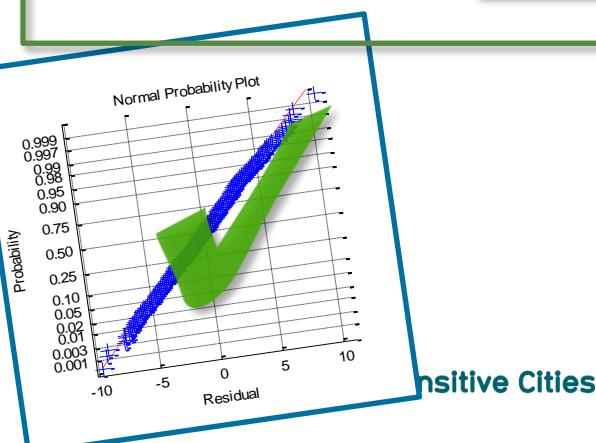

Scenarios
<i>Unverified</i>
<i>Not normal</i>
<i>Verified1</i>
<i>Verified2</i>

$$Q^* = \frac{(Q + \lambda_2)^{\lambda_1} - 1}{\lambda_1}$$

**Box-Cox
transformation**

normality assumption was verified, but no weights were applied to the data

Positive Cities

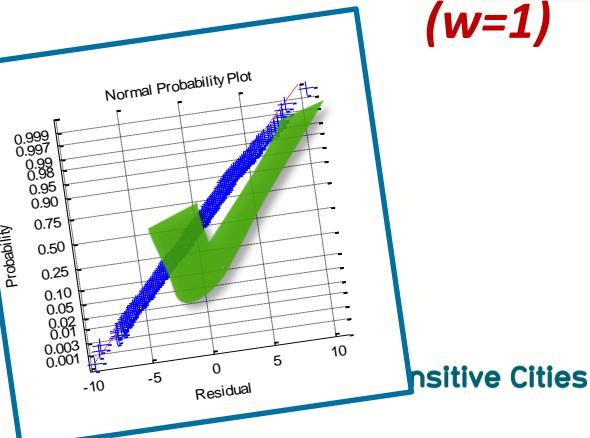

Scenarios

Scenarios	$w = 1$
Not normal <i>Unverified</i>	normality of the residuals was checked but not verified

Box-Cox transformation

$$Q^* = \frac{(Q + \lambda_2)^{\lambda_1} - 1}{\lambda_1}$$

**Normal & no weights
($w=1$)**

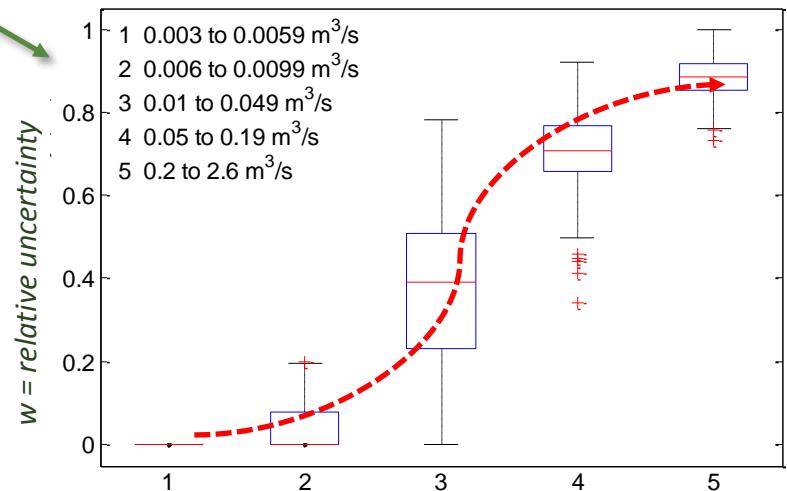

Verified1

normality assumption was verified and a weighting strategy that gives more importance to high flows in the likelihood function was applied

Verified2

normality weights

Scenarios

Scenarios	
<i>Not normal</i>	<i>Unverified</i> normality of the residuals was checked but not verified
<i>Normal & w = relative</i>	<i>Verified1</i> normality assumption was verified and a weighting strategy that gives more importance to high flows in the likelihood function was applied
<i>Normal & no weights (w=1)</i>	<i>Verified2</i> normality assumption was verified, but no weights were applied to the data

Results

Analysis of results

- Model efficiency
- Model sensitivity
- Prediction parameter uncertainty
